

DFM10 Source-Level Training Data Quality Audit

Danish Foundation Models / HRM-Text data pipeline

27 August 2026

Audit method

This report aggregates the completed source-level audit in `logs/data_audits/dfm10_source_quality_a4b_20260826/dfm10_source_quality_audit.jsonl`. The inventory covers 177 logical sources and 17,455 exact prompt/assistant examples visible to the DFM10 training pipeline. Sampling was deterministic (seed 20260826), uniform within each source's eligible rows, and capped at 100 examples per source; sources with fewer eligible examples contribute all available examples. The report therefore estimates per-source quality, not token-weighted corpus quality.

Each example was judged by Gemma 4 26B-A4B-it using an explicit JSON schema on three 1–5 dimensions: language quality, instruction/answer coherence, and training value. The judge also supplied issue lists and a binary *usable-for-training* decision. The run contains zero judge errors. These are model-based screening results, not substitutes for human review, provenance review, contamination analysis, or task-specific correctness tests.

The severity index ranks the table as

$$100 \left[0.50(1 - u) + 0.15 \frac{5 - L}{4} + 0.20 \frac{5 - C}{4} + 0.15 \frac{5 - V}{4} \right],$$

where u is usable rate and L, C, V are the three mean scores. Thus unusable examples dominate, coherence is next, and language/training-value deficits break ties. Bands are critical ≥ 50 , high ≥ 30 , moderate ≥ 15 , and low < 15 . Qualitative findings report the two most frequent issue categories per source and the percentage of sampled rows exhibiting each category.

The post-training column assesses the *current converted source* for supervised post-training of a conventional pretrained decoder-only LLM: **Yes** means directly relevant and sufficiently coherent; **Conditional** means useful after filtering or as a narrow auxiliary task; **No–repair** means conceptually relevant but the current conversion is too broken; and **No–midtrain** denotes continuation-style data better treated as midtraining or continued pretraining. This assessment is independent of HRM's recurrent architecture.

Aggregate results

Across all judgments, 86.2% were marked usable. Mean language, coherence, and training-value scores were 4.87, 4.49, and 4.28. Source counts by severity were: 8 critical, 11 high, 39 moderate, and 119 low. Post-training assessments were: 122 Yes, 43 Conditional, 10 No–repair, and 2 No–midtrain.

The strongest immediate exclusions are the sources at the top of the table. In particular, the Arabic and Ukrainian machine-translation conversions show systematic target mismatch; DBC has a prompt/target language-policy defect; GovReport targets are frequently unsupported by truncated prompts; and Scientific-Summaries contains widespread truncated targets. These are actionable conversion or source-filtering defects rather than evidence that the underlying task families are intrinsically unsuitable.

All audited sources, most severe first

Interpretation limits

The 100-example cap gives useful source-level triage but wide uncertainty for rare defects and heterogeneous sources. Issue percentages can overlap because a single row may exhibit multiple problems. The post-training assessment is a pipeline decision aid, not a license, privacy, or safety determination. Before exclusion or high-repeat sampling, inspect the underlying rows and validate any converter repair on a fresh holdout sample.
